

I will provide a spreadsheet containing card attributes necessary to implement this functionality.
Card Name: Type, Stat, Cost, Color, Status

There must be invisible zones which cards can snap to in the zones. It must be possible to drag a card from one zone and have it snap to another. 5 cards can fit in each zone in the current playmat.

1. Additional right-click context menu item "Play"

A. From the Hand:

1. Places a card from the hand into its corresponding type-zone (on the side of the board of the player who used the "play" option). NOTE: Any card can be played into the narrative zone.
2. After clicking "play", available (unoccupied) zones are highlighted, and the player can click one to have the card be put into that zone (centered/straight).
3. The player has to click a number of untapped mana (all cards must have tapped/untapped attribute) which corresponds to the card's cost (there is a check of the card's cost attribute). The mana available to tap has increased brightness/border during this action. There must be some indication that a player has clicked an individual mana for this purpose (perhaps reduce the brightness or change the border color of a clicked card).
4. Once the player clicks the corresponding number of mana, they are tapped (turned 90 degrees), their brightness returns to normal, and the card is placed into its corresponding zone.

B. From any other Zone:

1. Same as "Play", except the mana process is skipped.
2. The card can be Played in the corresponding zone of the player who pressed the button.

2. Additional right-click context menu item "Play As Energy" (mtg land). ("Play as Energy")

1. This doesn't have any costs (it skips the mana check)
2. The card goes upside down into the player's Energy zone (face up), successively stacked according to IMAGE_1.

Here are 3 untapped energies.
They are played like upside down
Frenned cards, but they are not
grouped unless explicitly group via
a Frenning operation – they can be
individually tapped.

2. Additional right-click context menu item “Fren”

1. If it is a non-fren card (a card attribute), it's the same as “Play”, except the card can only be played on top of another card the player controls of identical type-attribute.
2. If it is a fren card, then all their cards on the board light up like the mana from the “Play” function, and they must click a number of cards equal to the Fren's stat (an attribute). The Fren is played into its zone (indicated by another attribute), with all the clicked cards stacked under it and grouped according to IMAGE_2. This creates a composite card which is tapped and untapped as a single unit.

This composite card is composed of 3 cards. When a card is frenned, it must create a grouped card in this fashion, adding additional cards centered with a vertical offset.

When Frenning a card to an already composite card, the new card goes on top, and the entire composite card is vertically centered again in its zone.

The cards are designed so they can be stacked to make composite cards. Only the bottom part contributes to the total effect of the composite card.

3. Change a card on the board's tap attribute by pressing "E". Cards can already be rotated/tapped via default functionality, but I want it to change the card's attribute, and also by default, upon game load, to shift a card from tapped to untapped state (so a player doesn't have to circle it all the way around using the default rotation functionality). It is necessary to modify the tap attribute, because all tapped cards need to be untapped at the start of a player's turn automatically (see below for turn phase management).

5. Additional right-click context menu item "Archive"

Sends a card to it's owner's archive zone (graveyard)

4. Additional right-click context menu item "Banish"

Sends a card to the Void.

5. Additional right-click context menu item "Collect". (Just rename the default "Draw" option)

Sends a card to its controller's Hand.

6. Remove all the non-custom context menu options to keep it clean and simple. Only context menu options pertinent to this game implementation.

A small box in the right corner that indicates the current turn phase and whose turn it is. A player can click "End Turn" to automatically untap the other player's card's and draw a card into their hand from their deck.
